🚨 Root cause found — the .replit file:

```
[userenv.production]
SEED_ADMIN_FORCE_RESET = "true"
```

This is baked directly into the project file. Every single publish resets both admin passwords. This is why you kept getting locked out — every time you published anything, your known password was overwritten by the seed values. This has been quietly destroying every fix we made.

What else I found:
CORS — already correct (app.ts):

- absustaininvest.com ✅
- www.absustaininvest.com ✅
- cash-clip.app ✅
- www.cash-clip.app ✅

Wrong URLs in the mobile app (cashclip/constants/app.ts):

- cashclip.app/privacy — missing the hyphen, should be cash-clip.app/privacy
- cashclip.app/terms — same issue

Portal URL — on absustaininvest.com the correct path is:
https://absustaininvest.com/absustain/sc-portal

Proposed fix order — awaiting your approval one at a time:

1. Remove SEED_ADMIN_FORCE_RESET = "true" from .replit — stops the password-reset-on-every-publish loop
2. Reset your support password once more directly in the DB to something you choose
3. Fix the two wrong URLs in the mobile app constants

Say the word for each one.
